What is Pool Quartz?
Answer = A Superior Pool Finish

What is Pool Quartz?

Answer = A Superior Pool Finish
That will last for years.

It is a Genuine Quartz (99.8% pure) mineral that is crushed to size to obtain it's consistency, that enables it to be mixed with white cement to provide an extremely hard, durable, long lasting chemical and salt water resistant swimming pool finish. It has been developed and tested over a 10 year period in New Zealand.

Colours

The same material is coated with pigment and fused onto it, in high temperature kilns, this provides a colourfast finish that will not bleach out in swimming pool water.

Colour Range

Almost any colour can be achieved. Pool Quartz does not use Oxides because they fade over time.

Application

The same methods that have been used in the pool industry for years. To apply plaster covering the pool from direct sunlight is recommended.

Shelf life

This is the most important aspect of Pool Quartz. Many imported or manufactured pool finishers have the most important ingredient added to them when packed. This is Cement

Cement has a shelf life. This could have expired by the time it reaches your pool. If this is the case the surface will cure to half its strength and cause the finish to become exposed and rough as time goes by. Pool Quartz has all its cement added to it on site providing maximum strength, durability, and a smoother finish.

For Consideration

- | | |
|----------------|--|
| Cost factor | * Affordable,
* less expensive |
| Colour range | * Extensive |
| Pool chemistry | * This is a real plus the Quartz is inert and ideal for pool chemistry making water treatment simpler. |

Combine Pool Quartz with our range of Glass Pool Tiles and you could have the perfect pool finish for years to come.
